Linux Fast Boot Time

We can measure and optimise your Linux system to get fast boot time. We will use standard Linux tools to measure the boot time and modify a number of software layers that bring the desirable results.

The optimisation involves Linux kernel configuration, appropriate Linux subsystems selection, as well as source code modifications. Moreover, boot loader, as well as libraries are optimised to achieve faster loading time.

We have seen boot time reduction up to 90% by optimising key areas in the system.
